

# DC - distribution and protection components

## Introduction

Photovoltaic systems are composed by photovoltaic panels, cables, fuses, switches, overvoltage arresters and power inverter. Photovoltaic panels utilise the power of sun light to convert photons to DC current.

Electricity generated by solar panels is then fed into a power inverter that converts DC current to AC current. gPV fuse has been developed to protect cable and panel against "reverse" overcurrent.

ETITEC B, C-PV series of over voltage surge protective devices has been developed to protect against direct and indirect lightning discharges and is intended to protect photovoltaic systems.

The circuit topology consists of two varistors stages each protected by a thermal disconnection device.

## Overcurrent protection

■ PV module protection from »DC REVERSE« current on DC side Array with three or more strings of panels:

PV systems that have three or more strings connected in parallel need to have each string protected by fuses.

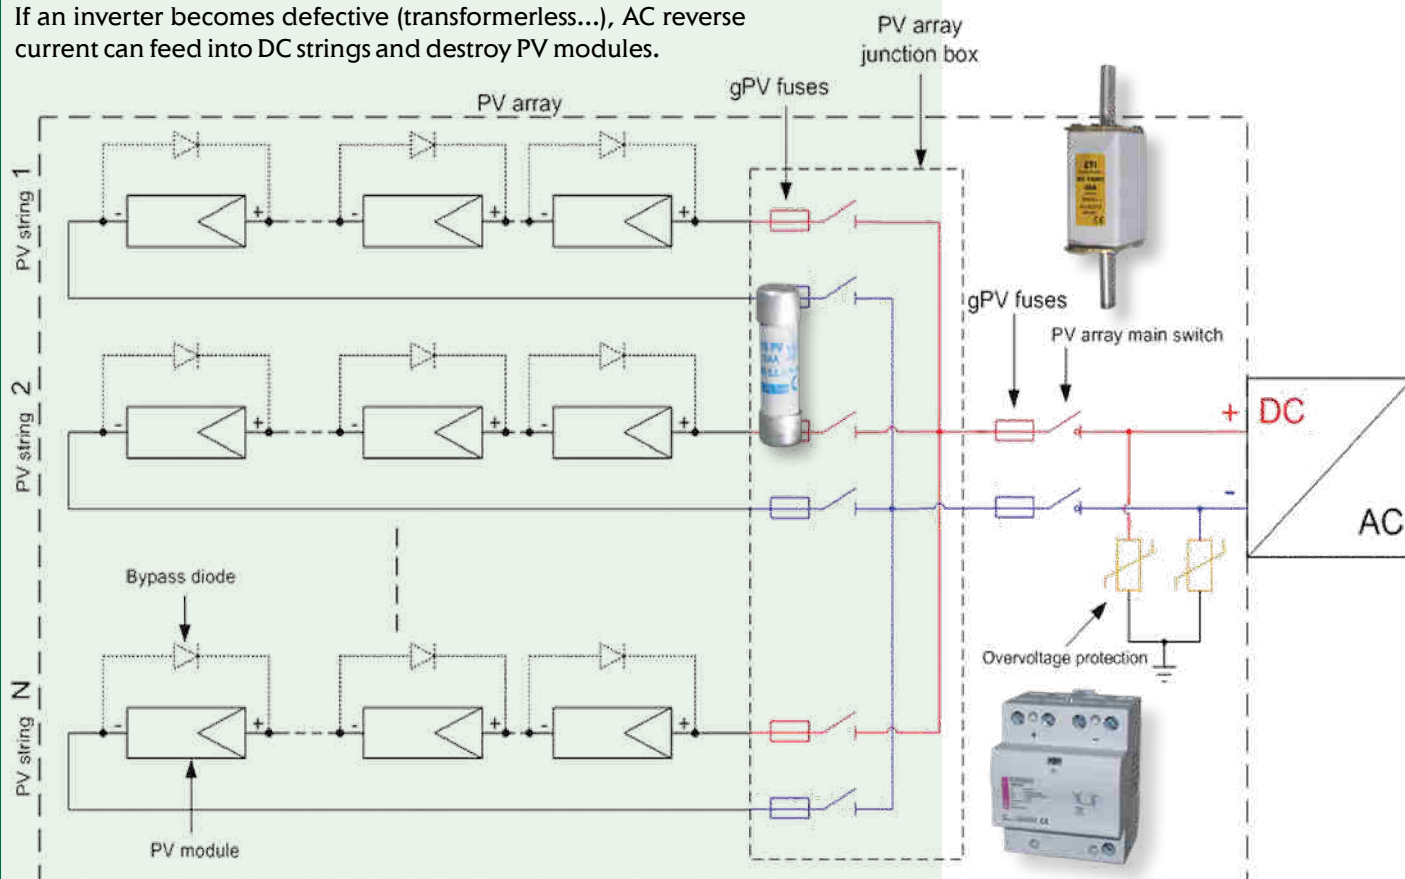

Systems that have less than three strings will not generate enough fault current to damage the conductors/solar panels.

Normally there are two gPV fuses connected on each string (+ and - pole), that protect conductors/solar panels from damage and eliminate any safety hazards.

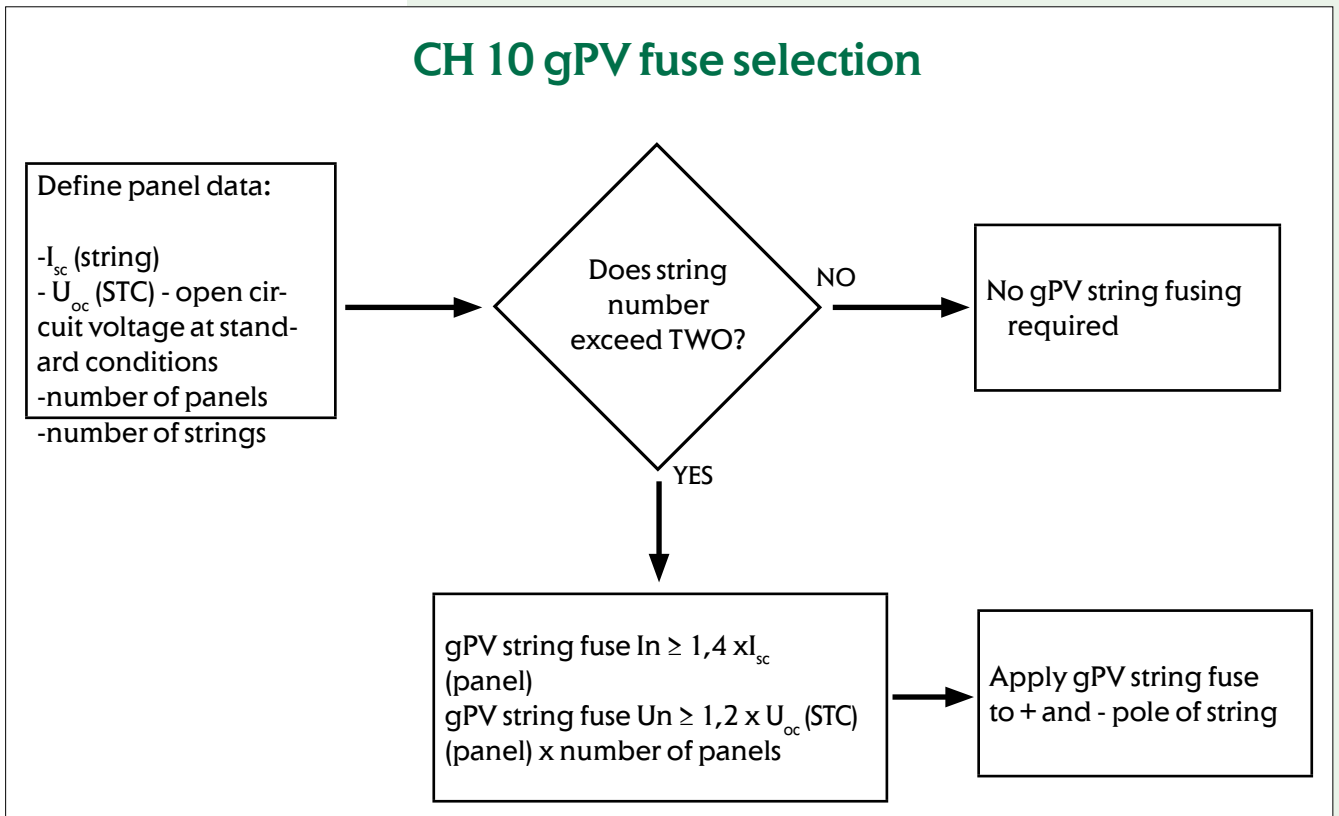

Fuses isolate the faulted string. The rest of PV system can continue to generate electricity.

■ PV module protection from »AC REVERSE« current caused by defective inverter

If an inverter becomes defective (transformerless...), AC reverse current can feed into DC strings and destroy PV modules.

# PV switch disconnector LS DC

The construction of the switch ensures reliable switching up to 58A with 1000V in the category DC 21B. The construction of the contacts and the material selection guarantee that no oxidation (small switching frequency develops, and is thus prevented inadmissible heating-up). The switch disconnector has 2, 4 or 4+2 contacts, by serial / paralel wiring of the contacts the contact rating will be increased. The switching speed at the manually operated handle does not have an effect on the switching attitude of the contacts.

### General characteristics

Rated voltage	≤ 1000V d.c.
Rated current	≤ 58A d.c.
Standards	IEC 60364-7-712
Application	For interrupting the DC/AC inverter from the solar panels

LBS DC are manually operated multipolar load break switches.  
 Making and breaking capacity under load conditions up to 1500 VDC.  
 These extremely durable switches have been tested and approved for use in the most demanding applications. They have been designed and tested for all types of applications: earthing, floating or bipolar.

- Thanks to a reduced number of bridging bars, you can limit your costs and save mounting time
- A 2 pole switch has reduced warming and can be placed in a smaller enclosure
- can be directly connected to up to four independent PV panel strings (4 pole switch)
- tested to critical currents and at 10kA short circuit during 50 ms without specific protection

High quality materials glass fibre reinforced polyester frame provide:

- high mechanical strength,
- stability to temperature variations (RTI of 130 ° C)
- high dielectric strength (high CTI / tested as per standard ASTM D 2303)

## NV/NH - low voltage knife blade fuses and disconnectors

ETI offers a new generation of low-voltage fuse-links from size NV00C up to NV3 with new, dual indication of fuse-link operation, called KOMBI. The indicator is easily visible on the top and centre of the fuse-link, whether it is situated in a standard fuse base or vertical fuse rail or in fuse-switch disconnector.

Fuse links with gG characteristic with rated voltages 400 V a.c., 500 V a.c., 690 V a.c. and 1000 V a.c are available in versions with and without striker pin, with rated current from 2 A to 1600 A, depending on the selected product.

We also offer:

- NV fuse-rails sizes 00, 1, 2, 3 with accessories
- NV disconnectors with fuses sizes 00, 1, 2, 3, 4a.

ETI can also design and produce special non-standard fuse-links on customers' request.
